

F. Baldi is Associate Professor in Materials Science and Technology at the Department of Mechanical and Industrial Engineering of Università degli Studi di Brescia. He took a degree in Chemical Engineering in 1998 (full marks "cum laude"), worked in R&D department of an Italian company (Turin, I) that produces instruments for the mechanical and rheological characterization of polymers and composites, and in 2002 he moved to the University of Brescia. His research activity is mainly experimental, and concerns: 1) Mechanics of polymeric materials: development of fracture mechanics testing methodologies for the determination of fracture resistance parameters under quasi-static and high-rate (impact) loads; analysis of mechanical failure phenomena; study of large deformation behaviour; research of structure-property relationships in micro- and nano-composites. 2) Rheology of polymeric materials: capillary rheometry; study of the rheological behaviour of polymer melts filled with rigid particles; analysis of instability phenomena in capillary flows ("melt fracture"). 3) Polymer processing: research of relationships between processing conditions, micro-structural characteristics and mechanical properties in components manufactured by innovative techniques; analysis and optimization of compounding processes. He is member of the Technical Committee 4 "Polymers, Polymer Composites and Adhesives" of the European Structural Integrity Society (ESIS). Within ESIS TC4, he is coordinator of a specific work area ("Jc testing"). He is member of the working group "Fracture and fatigue behaviour", WG7, of the subcommittee "Mechanical behaviour", SC2, of the technical committee "Plastics", TC61, of ISO. He is associate of the Institute of Intelligent Industrial Technologies and Systems for Advanced Manufacturing of the National Research Council of Italy.
